

Motivation

- Camera traps change continuously over time (season, weather, species).
- Such non-stationary shifts make continual learning necessary.
- We provide a **unified ML-ready benchmark** to study this real-world continual setting.

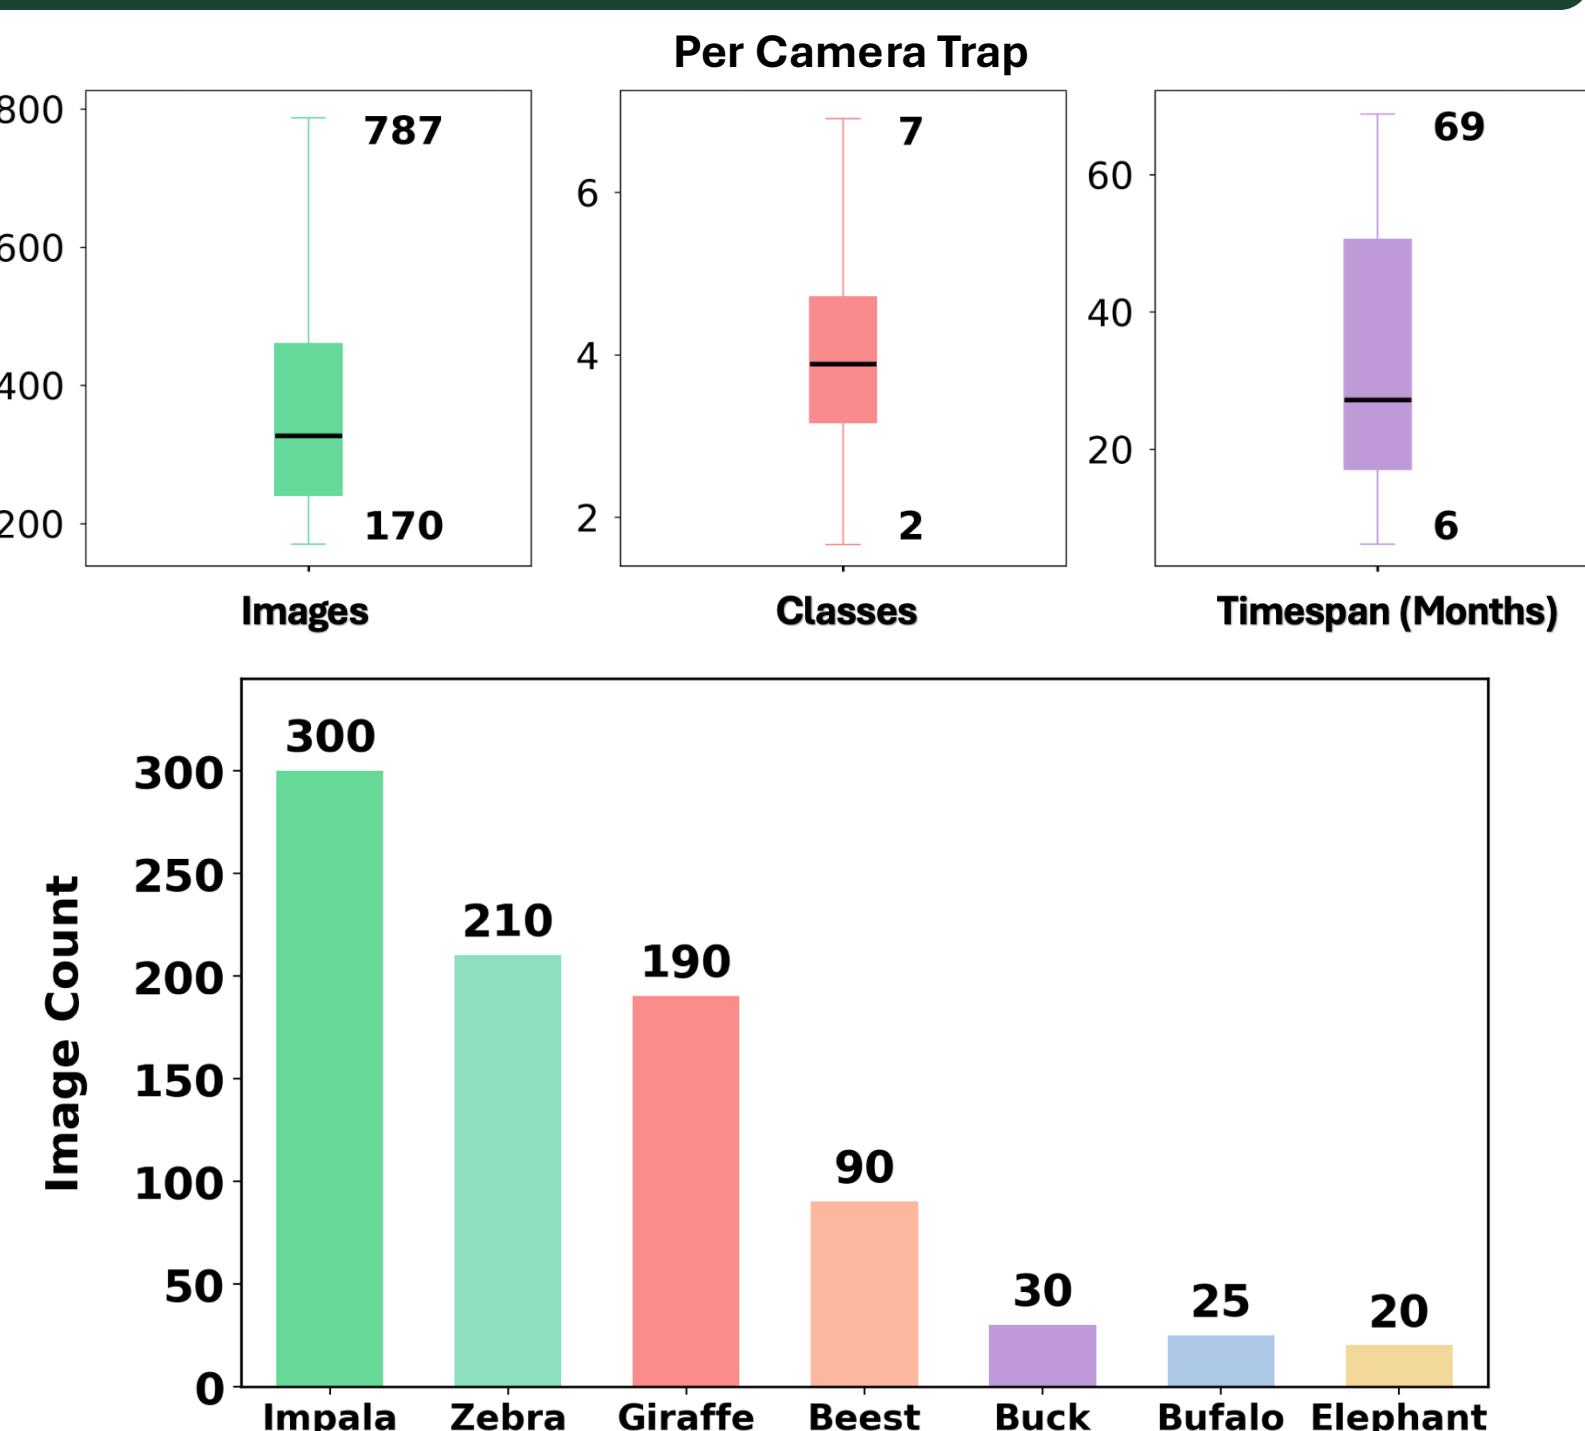

Setup - Online Continual Learning

Benchmark Statistics

Benchmark Overview

Camera Traps	546
Continents	4
Images	3.32M
Classes	162

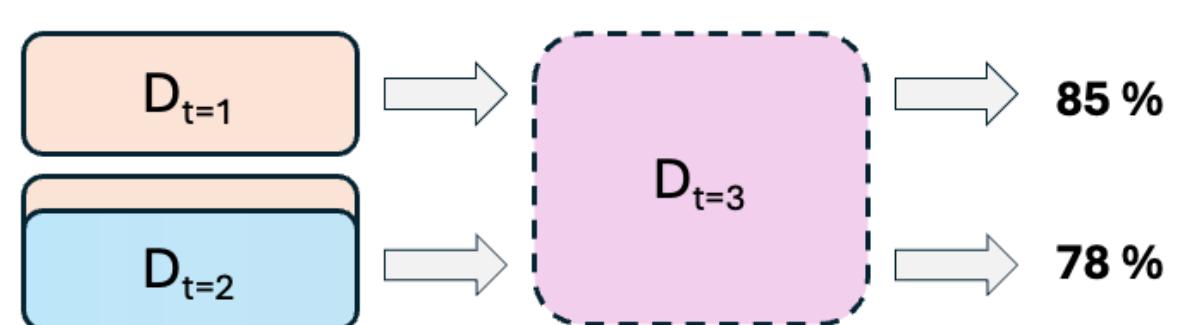

When Should We Adapt?

Do We Need to Continuously Adapt?

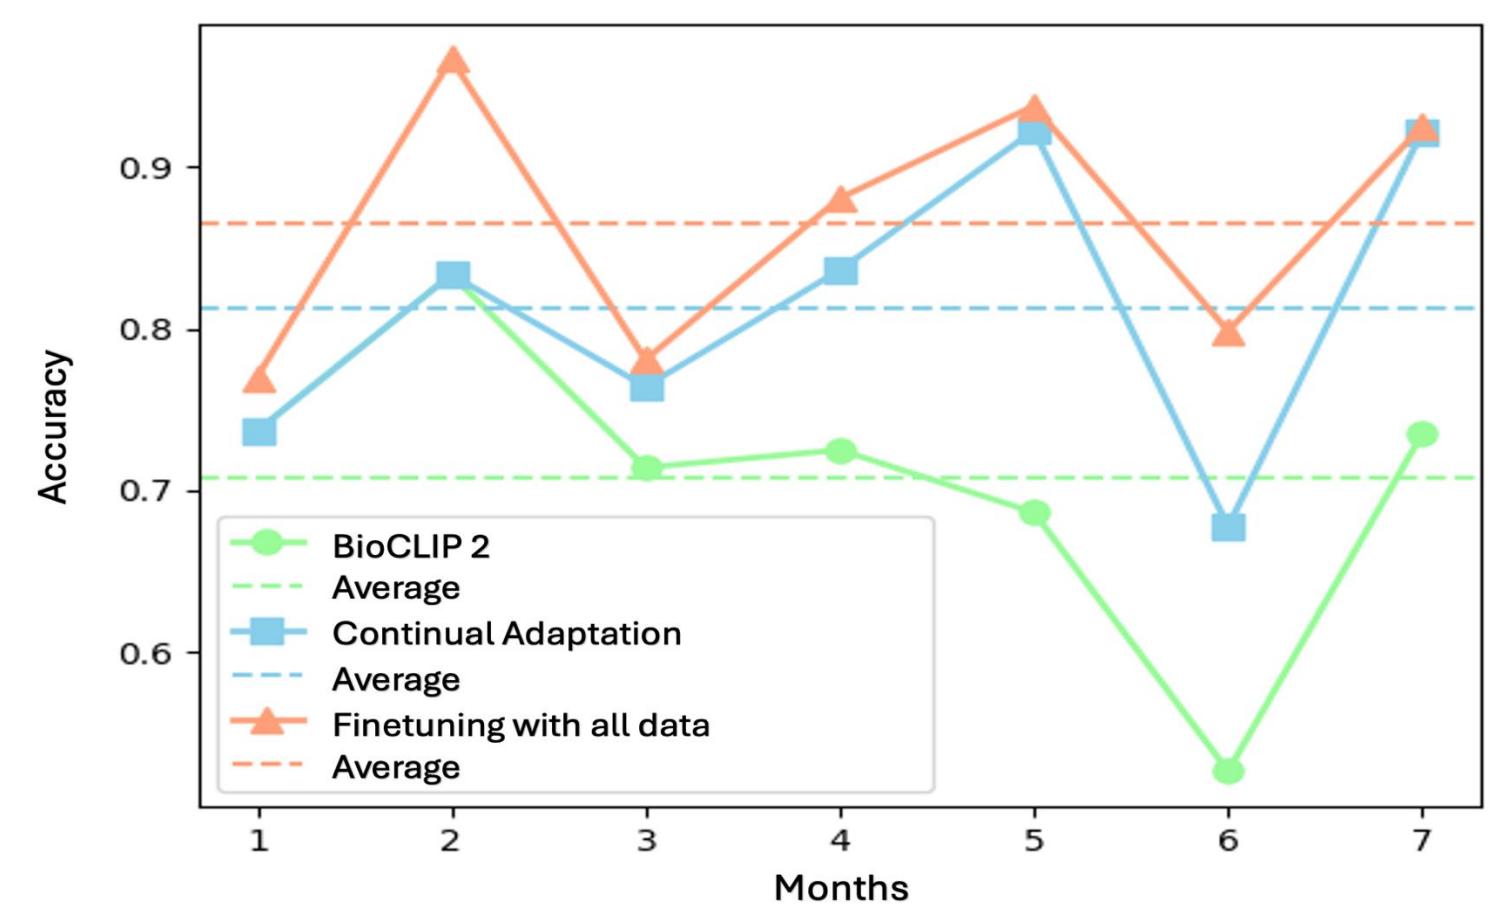

Adapted Months	0%	33%	66%	100%
Accuracy	73.1%	77.6%	79.7%	80.3%

Do We Need to Continuously Adapt Every Month?

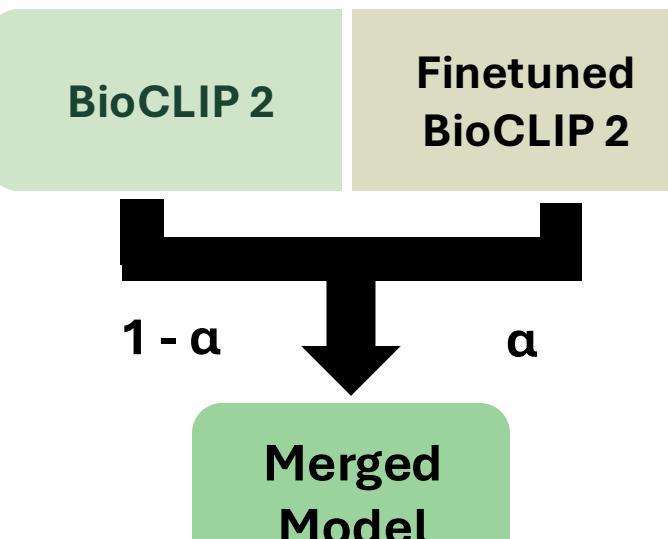

Continual Adaptation is Even Harder

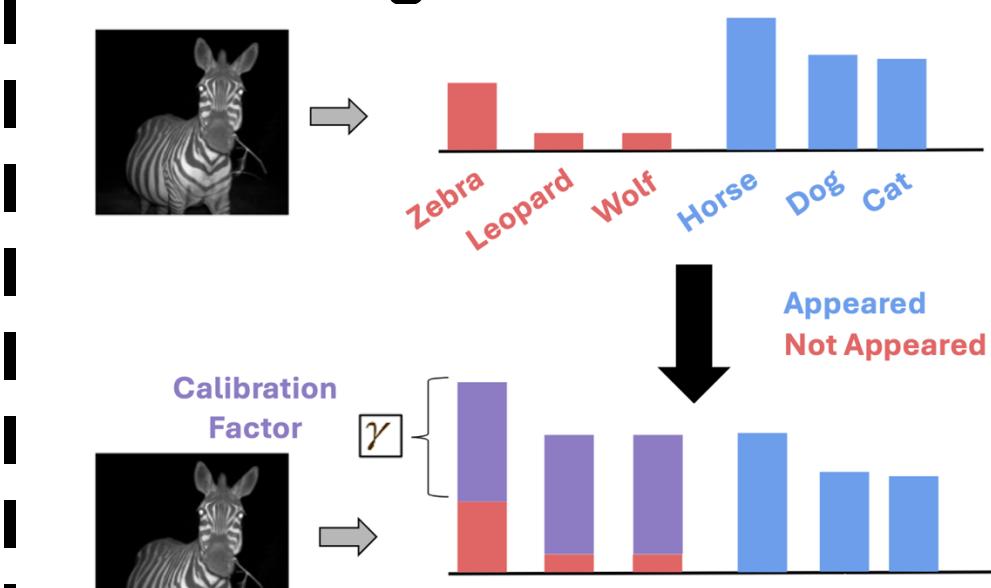

- Continual adaptation **may not work** every month!
- Techniques like **post-hoc methods** can be a solution.

Weight Interpolation (Model Merging)

Logit Calibration

Open Questions

- Better imbalance loss or PEFT for stable adaptation?
- How to auto-select the best α or calibration factor?
- How often should a model adapt over time?
